

Why a Stock Peak Isn't a Cliff

S&P 500 INDEX RETURNS, 1926-2020

Average Annualised Compound Returns

■ After months that ended at a record
 ■ After months that ended at any level

Many investors may think a market high is a signal stocks are overvalued or have reached a ceiling. However, they may be surprised to find that the average returns one, three, and five years after a new month-end market high are similar to the average returns over any one-, three-, or five-year period.

- In looking at all monthly closing levels between 1926 and 2020 for the S&P 500 Index, 30% of the monthly observations were new highs.
- After those highs, the average annualised compound returns ranged from nearly 14% one year later to just under 10% five years later. Those results were close to average returns over any given period of the same length.

Reaching a new high doesn't mean the market will retreat. Stocks are priced to deliver a positive expected return for investors, so reaching record highs regularly is the outcome one would expect.

Past performance is no guarantee of future results. Indices are not available for direct investment. Their performance does not reflect the expenses associated with the management of an actual portfolio.

In US dollars. For illustrative purposes only. New market highs are defined as months ending with the market above all previous levels for the sample period. Annualised compound returns are computed for the relevant time periods subsequent to new market highs and averaged across all new market highs observations. There were 1,139 observation months in the sample. January 1926–December 1989: S&P 500 Index, Stocks, Bonds, Bills and Inflation Yearbook™, Ibbotson Associates, Chicago.
